Solar Auxiliary Heating “powered by SCHOTT”

With the high-performance ETC16 collectors it is possible to make a significant contribution to the heating support even beyond the domestic hot water heating. Thanks to its vacuum insulation the ETC16 displays its strengths compared to other collectors especially well in spring and autumn. In well-insulated buildings it is possible to provide between 20 and 30 % of the total heat required for heating purposes, at a moderate expense, by means of a solar thermal system with ETC16.
